KREOVAR

Cookie Policy

Effective date: 1 November 2026 | Version 2026-11-01

How Kreovar uses cookies and browser storage for sign-in, preferences, drafts and media recovery, and how you can manage that data.

1. About this policy

This policy covers cookies and similar browser storage used on kreovar.online. Cookies are small records the browser can send with requests to the same website. Local storage, session storage and IndexedDB keep information on your device and are different technologies, although they can serve similar purposes. Read this policy together with our Privacy Policy.

The storage used depends on whether you sign in and which tools you use. Not every item described here is created when you only read a public page. Some technical names retain the earlier fretrend or veelox prefixes; these names are used by Kreovar and do not identify a separate website operator.

2. Sign-in cookies

Purpose: keep your authenticated session available so you can use account tools and saved projects. Kreovar uses Supabase Auth with a custom cookie storage adapter. The cookie name starts with fretrend-auth and can be split into numbered parts such as fretrend-auth.0 and fretrend-auth.1. These cookies contain authentication information and must not be shared.

Duration: each cookie write or session refresh sets a browser lifetime of up to 30 days. An actively refreshed session can therefore last longer than 30 days overall. Signing out removes the current authentication cookie parts. Cookie lifetime does not guarantee that a session remains valid: account security settings, expiry or revocation can require you to sign in again.

The application sets these cookies for the current host with Path=/ and SameSite=Lax, and adds Secure over HTTPS. Blocking them can prevent sign-in from persisting or account tools from working. You can read public information pages without signing in.

3. Temporary sign-in and password recovery storage

The sign-in flow can temporarily store a PKCE code verifier using a name such as fretrend-auth-code-verifier, with numbered cookie parts when needed. This helps complete the sign-in or recovery request. The auth library normally removes it when the flow completes; if left behind, the same adapter gives a cookie write a maximum browser lifetime of 30 days.

Session storage named veelox-password-recovery records a short-lived recovery UI state. The application accepts that state for 10 minutes and clears it on sign-out or explicit recovery cleanup. The browser may retain an expired record until it is removed or the tab session ends. This record alone does not authorize a password change.

4. Preferences and feature storage

When you use studio features, local storage can remember settings, caption favorites and presets, custom templates, brand preferences, and cached tool results. Examples include kreovar-caption-favorites, kreovar-caption-presets, veelox_custom_caption_templates_v1 and veelox_brand_* entries. These values help restore the choices you make in the tools.

Local storage does not have a built-in expiry date. Entries can remain until the feature replaces or removes them, you clear site data, or your browser removes them. Cached results can have their own application freshness checks; that does not mean the stored record is immediately deleted when it becomes stale.

5. Projects, drafts and media recovery

Local storage can hold project lists and recovery snapshots, including veelox_projects_v2 and veelox_recovery_v2_* entries. IndexedDB databases such as veelox-editor-v1 can store project state and media used for browser editing and recovery. This supports the work you ask the editor to save or reopen.

These stores do not have a universal automatic deletion period. Data may remain until the application removes it, you clear site data, or the browser evicts it because of storage limits or settings. Signing out does not necessarily remove all local drafts, cached media or downloaded files. Save independent copies of important work before clearing browser storage.

6. Analytics, advertising and older referral data

The current Kreovar application does not load advertising pixels or optional analytics cookie tags. Service providers may still process connection, security and operational logs as described in the Privacy Policy; logs are not the same as an analytics cookie stored in your browser.

Referral collection is currently disabled. Older versions could save referral information locally and in a cookie with a lifetime of up to 30 days. Existing local records may remain until cleared. If we introduce optional tracking technologies, we will update this policy and provide the choices or consent controls required before activating them where applicable.

7. Hosting, sign-in, payment and external services

Netlify and Cloudflare provide hosting, delivery or security services and may use storage needed for routing or security checks when those services are active. Exact provider cookie names and lifetimes can vary with their configuration and the checks shown to you. Their privacy information explains their own processing.

If you choose Google sign-in or follow a Whop checkout link, the external service may use its own cookies on its own domains. Those services control their cookie settings and policies. A normal link to our Instagram profile does not embed an Instagram feed in this website; visiting Instagram brings you under that service's own settings and policies.

8. Managing cookies and site data

Use your browser settings to view, block or delete cookies and other site data for kreovar.online. Browsers often list local storage and IndexedDB under site data, storage or developer tools. Private browsing and automatic deletion settings may clear information when the session ends.

Blocking authentication cookies can sign you out or interrupt account access. Clearing local storage or IndexedDB can permanently remove local-only drafts and media recovery copies. Download or back up important work first. To request deletion of cloud account data, use the account controls or contact support; clearing browser data alone does not delete your cloud account.

Your current sign-in, cookie and storage settings can be managed through the browser and the service controls described above. This policy page does not itself create a new consent record or enable an optional tracker.

9. Updates and contact

We may update this policy when our storage use or service providers change. The effective date and version identify the current published policy. Questions about cookies, browser storage or privacy can be sent to info@kreovar.online. Do not include passwords, authentication cookie values, access tokens or full payment card details.
